Mississauga, ON
L4W 0A5

Dear Mr. MacNicol:

RE: Transportation Impact Study
Proposed Mixed-Use Development
90-104 Queen Street East, City of Toronto

LEA Consulting Ltd. is pleased to present the findings of our Transportation Impact Study for the proposed mixed-use development at 90-104 Queen Street East in the City of Toronto. It is prepared on behalf of QM Developments LP in support of a rezoning application. This report concludes that the traffic associated with the proposed development will have minimal impact on the surrounding road network.

Should you have any question regarding this Transportation Impact Study, please do not hesitate to contact the undersigned.

Yours truly,

LEA CONSULTING LTD.

Felipe Vernaza, P.Eng.
Senior Project Engineer
Transportation, Noise & Vibration Engineering

Timothy Chin, MSc(Eng), EIT
Intermediate Traffic Analyst

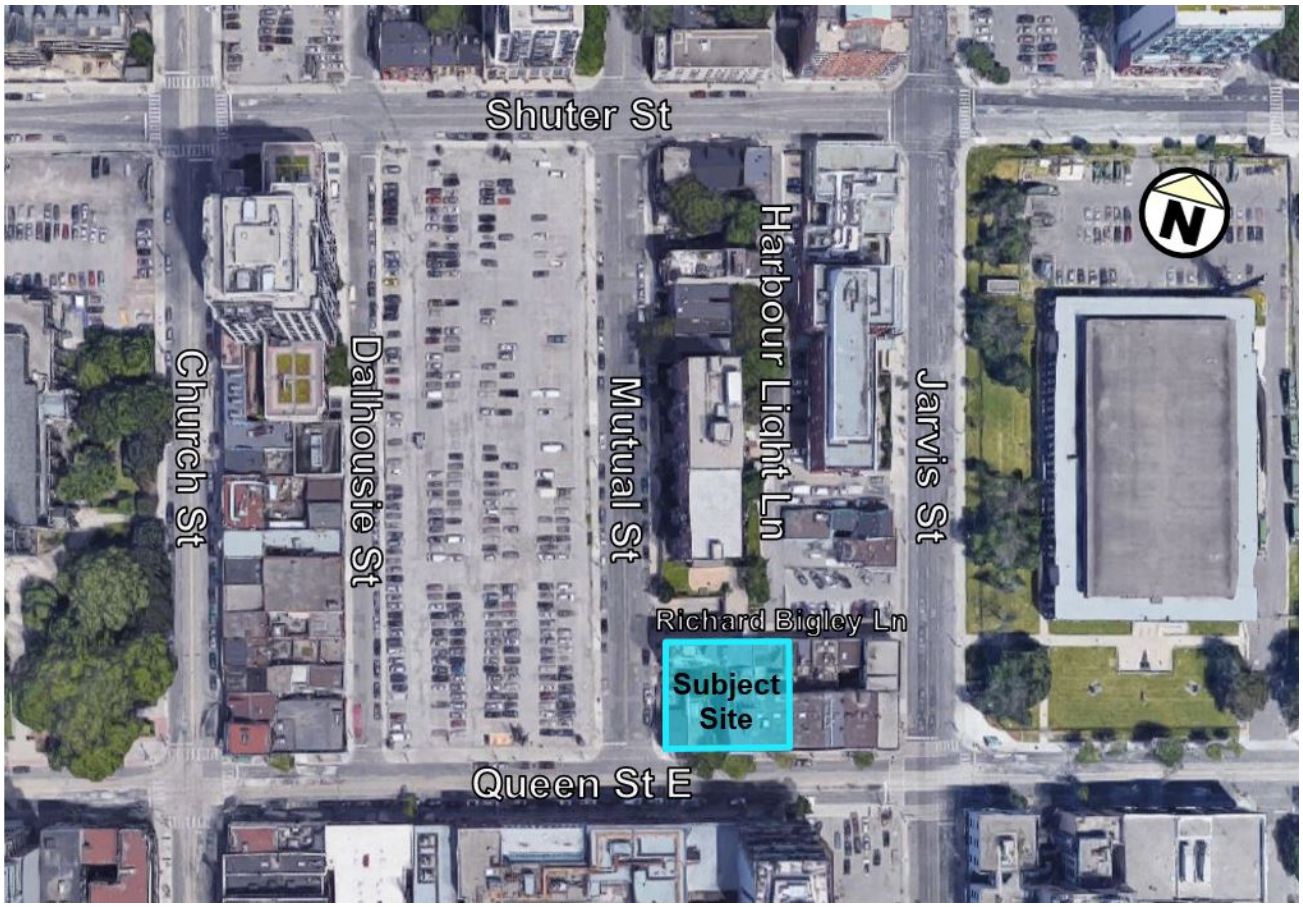
LIST OF TABLES

LIST OF APPENDICES

1 INTRODUCTION

LEA Consulting Ltd. (LEA) was retained by QM Development LP. to undertake a Transportation Impact Study (TIS) for the proposed mixed-use development to be located at 90-104 Queen Street East in the City of Toronto (herein referred to as the "subject site"). The subject site is located at the northeast corner of Queen Street East and Mutual Street and is currently occupied by multiple mixed-use buildings with at-grade commercial uses. The subject site location is illustrated in **Figure 1-1**.

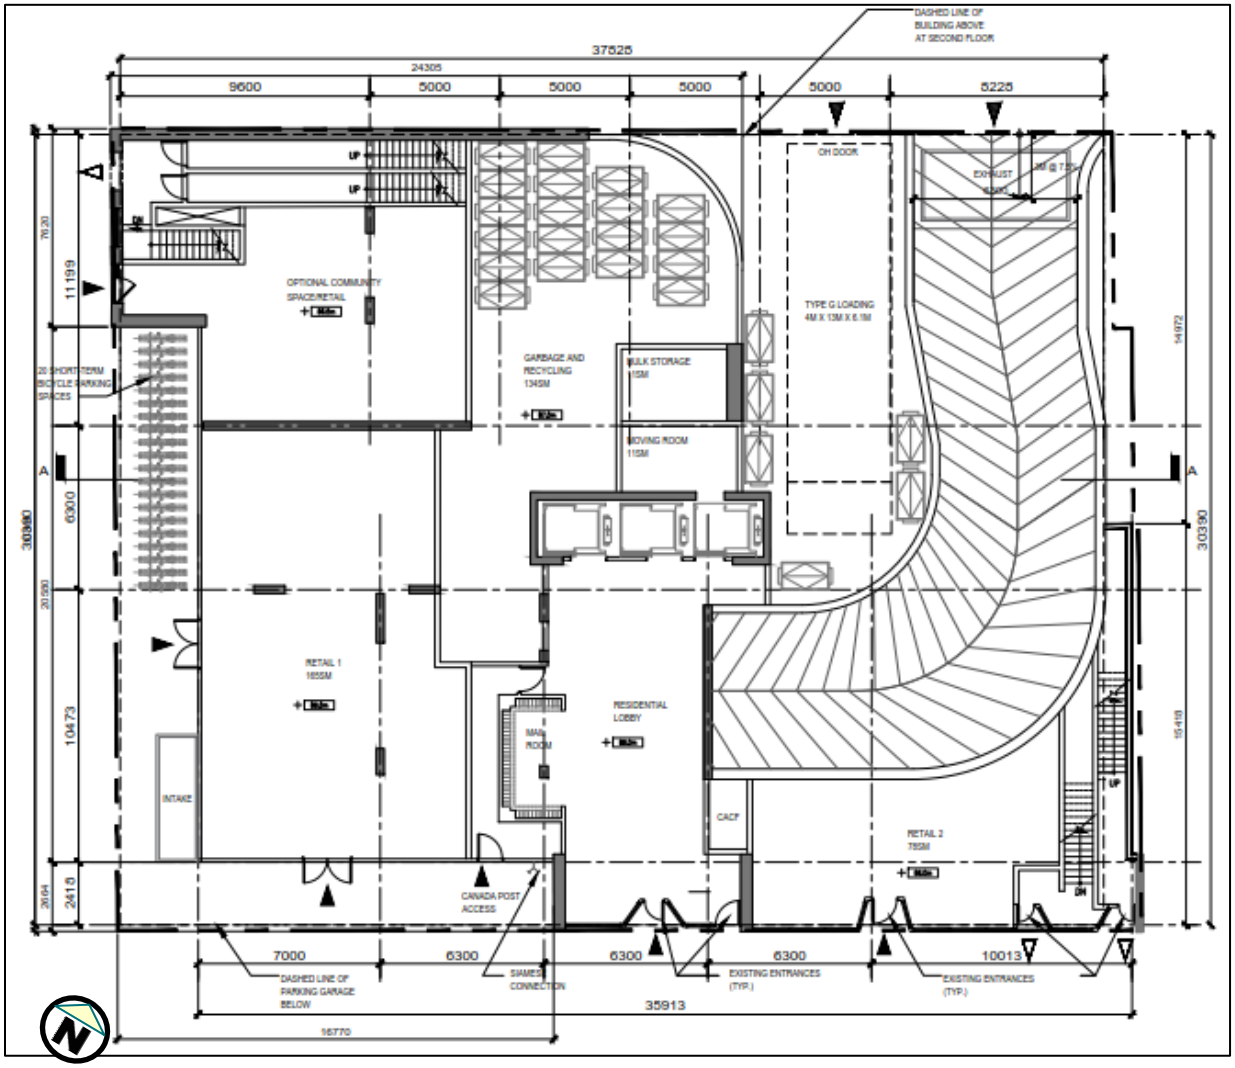
Figure 1-1: Site Location



Development Proposal

The development proposal consists of a mixed-use building, 34 storeys tall plus a wrapped mechanical penthouse, containing 356 units, 339 m^2 of ground-floor retail and 44 parking spaces, including six car-share spaces (effective parking supply of 61 spaces – more below), contained in three underground parking levels. Based on the site plan illustrated in **Figure 1-2**, the underground parking will be accessed from Richard Bigley Lane.

Figure 1-2: Preliminary Site Plan



Source: IBI Group. (December, 2018)

2 EXISTING TRAFFIC CONDITIONS

This section will identify and assess the existing transportation conditions in the study area, including the road, transit, cyclist and pedestrian network.

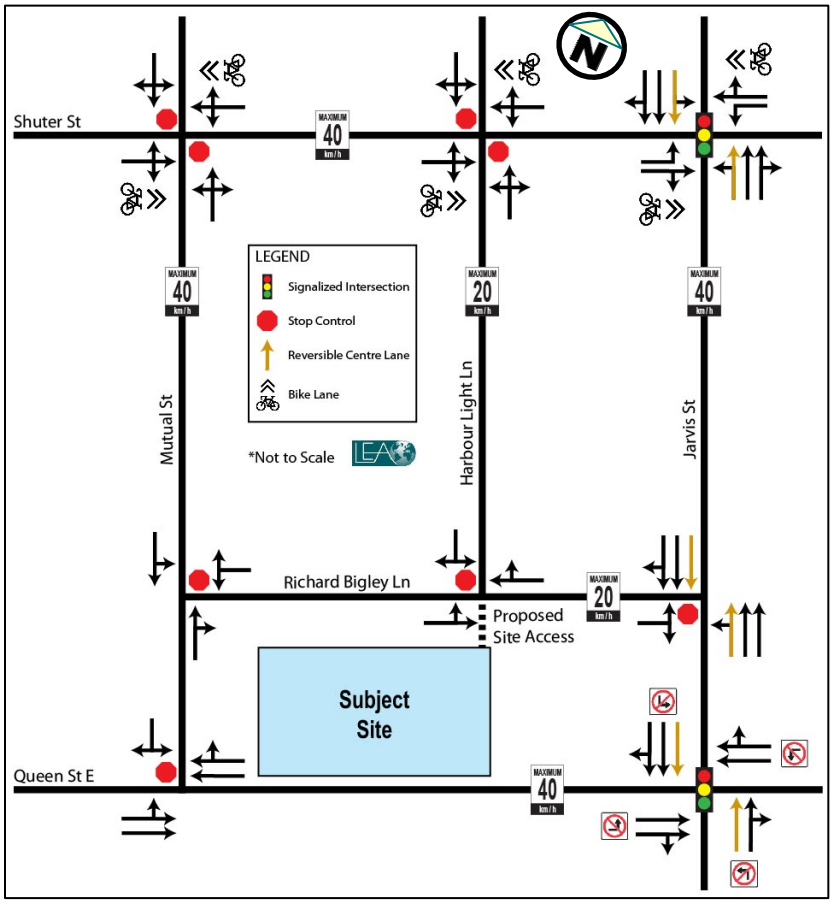
2.1 ROAD NETWORK

The Terms of Reference have been submitted and confirmed with City and the following intersections have been included in this study. The Terms of Reference are attached in **Appendix A**.

- Queen Street East & Jarvis Street (Signalized);
- Queen Street East & Mutual Street (Unsignalized);
- Shuter Street & Mutual Street (Unsignalized);
- Shuter Street & Harbour Light Lane (Unsignalized);
- Shuter Street & Jarvis Street (Signalized);
- Richard Bigley Lane & Harbour Light Lane (Unsignalized);
- Richard Bigley Lane & Mutual Street (Unsignalized); and
- Richard Bigley Lane & Jarvis Street (Unsignalized).

The existing lane configurations and road network information are illustrated in **Figure 2-1.**

Figure 2-1: Existing Lane Configuration



The existing roads within the study area are all under the jurisdiction of the City of Toronto. A detailed description of these roadways is provided below:

- **Queen Street East** is an east-west major arterial road with a four-lane cross-section (two lanes per direction) with streetcar tracks on both sides of the road in the vicinity of the subject site. The roadway operates with a posted 40 km/h speed limit in the study area.
- **Jarvis Street** is a north-south major arterial road with a five-lane cross-section. There are two lanes per direction and the centre lane functions as a reversible lane which operates as a northbound lane between 3:45 pm to 6:30 pm on Monday to Friday and as a southbound lane at all other times. The roadway operates with a posted 40 km/h speed limit in the study area.
- **Shuter Street** is an east-west minor arterial road with a two-lane cross-section (one lane per direction) and a posted speed limit of 40 km/h. Shutter Street contains dedicated bicycle lanes on sides of the road within the study area.
- **Mutual Street** is a north-south collector road with a two-lane cross-section (one lane per direction) within the vicinity of the subject site. The roadway operates with a posted 40 km/h speed limit in the study area.
- **Richard Bigley Lane** is an east-west laneway which provides access to the rear end of properties or parking garages for buildings facing Queen Street East.
- **Harbour Light Lane** is a north-south laneway which provides access to various developments or parking facilities, and connections Richard Bigley Lane to Shuter Street.

2.2 TRANSIT NETWORK

The subject site is located near many transit options including subway, streetcar and bus routes, serviced by the Toronto Transit Commission (TTC). The following TTC routes operate near the subject site.

Line 1 – Yonge-University is a "U-shaped" subway route running generally in a north-south direction along Yonge Street, University Avenue and Spadina Road. The route operates along Yonge Street from Finch Avenue East to Union Station in downtown Toronto, and then from Union Station to the Vaughan Metropolitan Centre. Line 1 provides connections to Line 2 – Bloor-Danforth at Bloor-Yonge Station, St George Station and Spadina Station. Line 1 also provides a connection to Line 4-Sheppard Line at Sheppard-Yonge Station. Line 1 subway trains run every 2-3 minutes during the AM and PM peak hours and every 4-5 minutes during off-peak hours. The nearest subway station to the subject site is Queen Station, located about 450 metres west of the subject site (approximately a 5-minute walk).

Route 501 – Queen is a streetcar route that operates generally in an east-west direction between Neville Park Loop and Long Branch Loop. It provides connections to the Line 1 subway at Queen and Osgoode Stations. The route's streetcars operate every 10 minutes or better all day. The nearest stops are located at the southwest corner (eastbound) and northeast corner (westbound) of Queen Street East and Jarvis Street intersection.

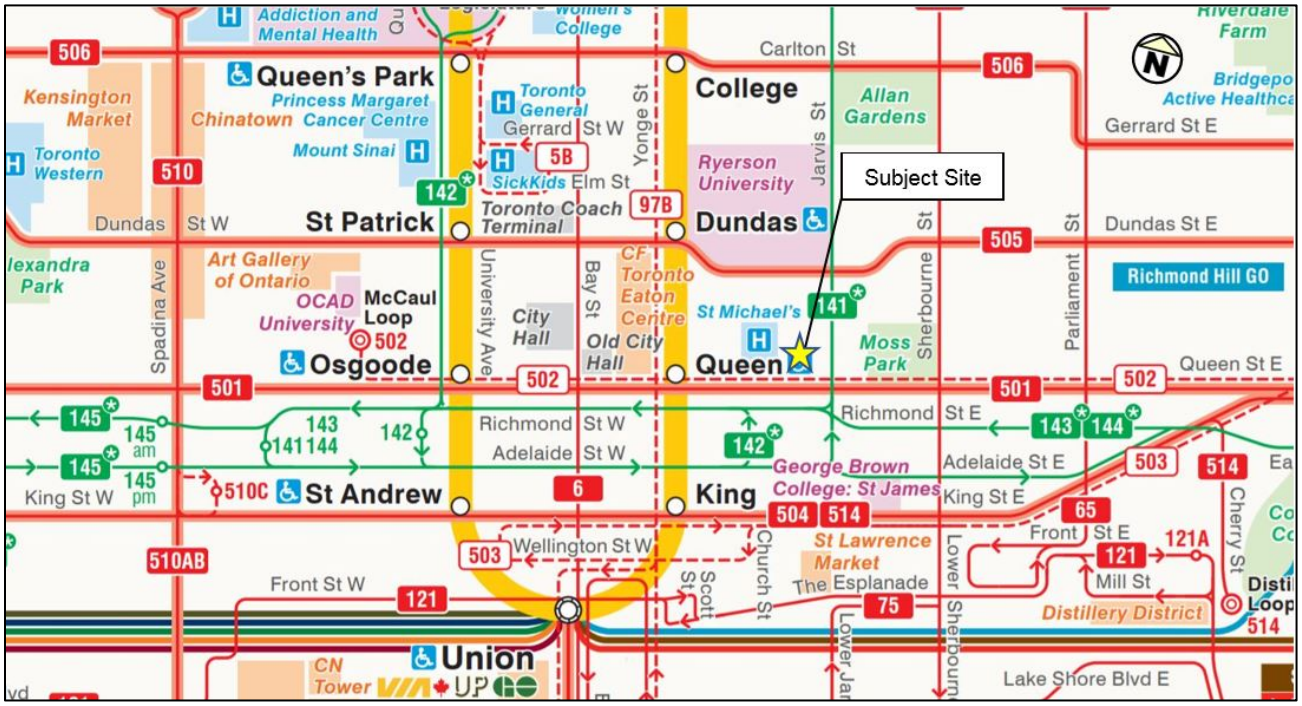
Route 502 - Downtowner is a streetcar route that operates generally in east-west direction between the area of Kingston Road and Victoria Park Avenue and the area of Queen Street West and McCaul Street. It provides connections to Line 1 subway at Queen and Osgoode Stations. The route operates 10 minutes or better during the peak periods and the midday period, from Monday to Friday only. The nearest stops are

located at the southwest corner (eastbound) and northeast corner (westbound) of Queen Street East and Jarvis Street intersection. Due to streetcar shortages, this route is temporarily being serviced by buses.

Route 141 – Downtown / Mt Pleasant Express is a bus route that operates generally in north-south direction between the area of Eglinton Avenue East and Mt. Pleasant Road and the Downtown Toronto area. Four southbound trips are operated during the AM peak and two northbound trips are operated during the PM peak, from Monday to Friday, with a 30-minute service frequency. The nearest bus stops are located at the southeast corner (northbound buses) and northwest corner (southbound buses) of Queen Street East and Jarvis Street intersection.

Figure 2-2 illustrates the existing transit network within vicinity of the study area, as of September 2018.

Figure 2-2: Existing Transit Services



Source: TTC (September 2018)

2.3 PEDESTRIAN NETWORK

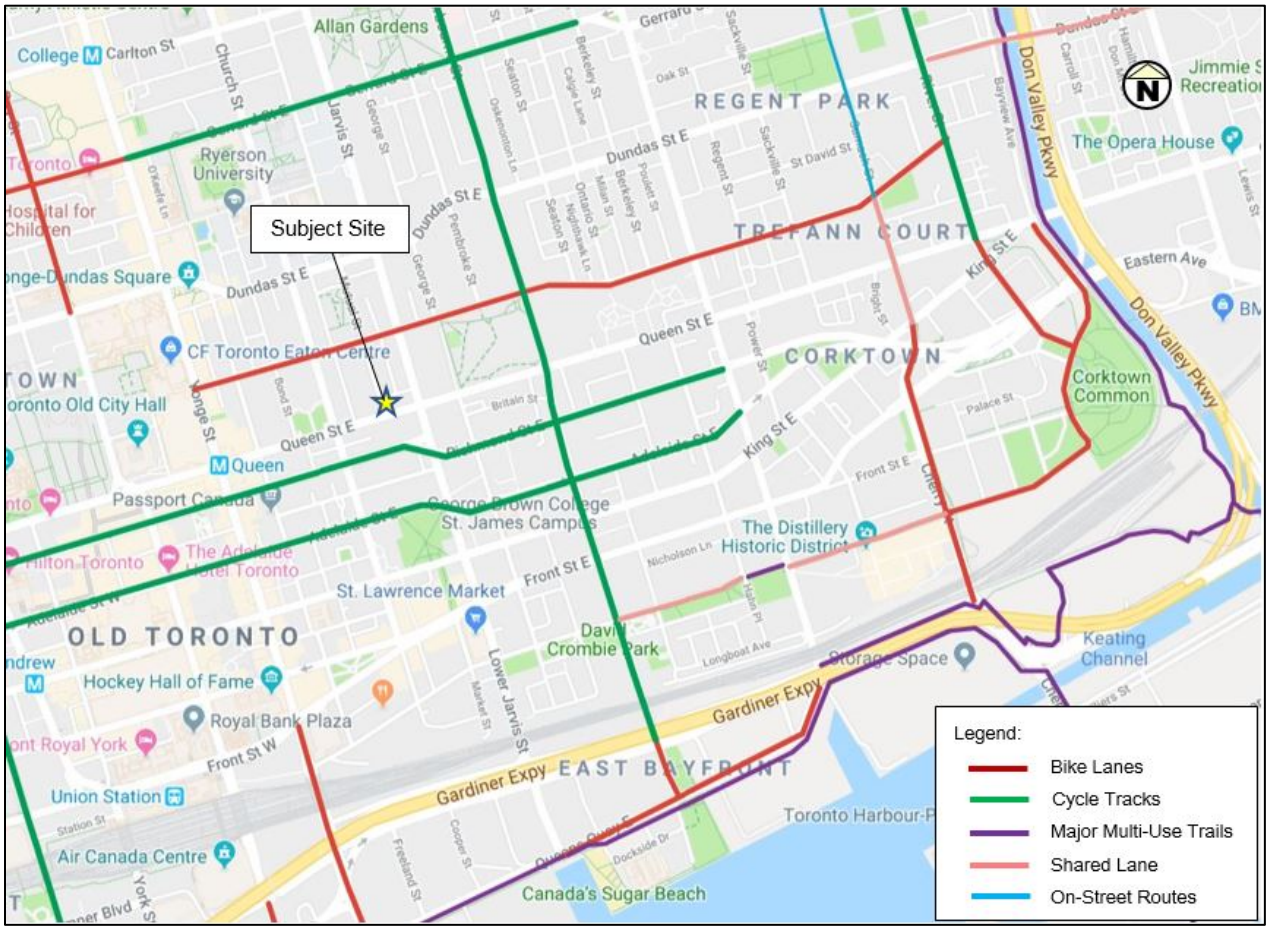
In the area immediately surrounding the subject site, continuous sidewalks are available on both sides of the street on Queen Street East, Jarvis Street, Shuter Street and Mutual Street, with crosswalks available at all signalized intersections. The existing pedestrian network provides good connections between the residential and commercial uses in the area as well as the nearby TTC bus/streetcar stops and Queen subway station which is essential for developments in the Downtown Toronto core.

2.4 CYCLING NETWORK

There are various cycling facilities accessible within a reasonable cycling and walking distance of the subject site. Dedicated bike lanes are provided along Shuter Street between Yonge Street and River Street. These

bike lanes are approximately 175 m north of the subject site and can be accessed via Mutual Street. These bike lanes connect to cycle tracks along Sherbourne Street which run in a north-south direction. Other nearby cycling infrastructure includes east-west cycle tracks on Gerrard Street, Richmond Street and Adelaide Street, along with a north-south bike lane on Cherry Street, and an on-street route along Sumach Street. The cycling network surrounding the subject site, as of September 2018, is illustrated in **Figure 2-3**.

Figure 2-3: Existing Cycling Network



Source: City of Toronto Cycling Network Map (September 2018)

2.5 DATA COLLECTION

Turning Movement Counts (TMCs) for the intersections within the study area were collected by LEA Consulting. Traffic volumes were collected during the weekday AM and PM peak periods between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM, respectively. A summary of the TMC data collection is outlined below in **Table 2-1**. Detailed TMCs and signal timing plans are included in **Appendix B.**

Table 2-1: Summary of TMC Survey

Intersection	Date of Survey	Source
Queen Street & Jarvis Street	November 2, 2017	LEA Consulting Ltd.
Queen Street & Mutual Street		
Shuter Street & Mutual Street		

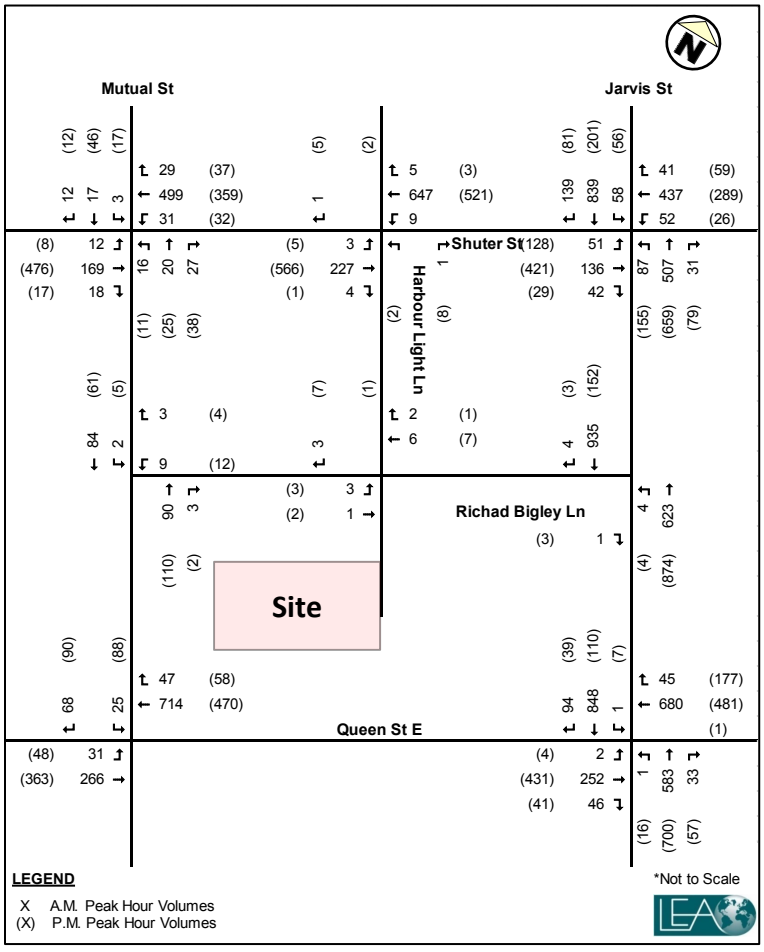
Shuter Street & Jarvis Street		
Shuter Street & Harbour Light Lane	October 2, 2018	
Richard Bigley Lane & Harbour Light Lane		
Richard Bigley Lane & Mutual Street		
Richard Bigley Lane & Jarvis Street		

Due to an ongoing watermain replacement project along Jarvis Street between Dundas Street and Queen Street, Jarvis Street was reduced to one lane, with left and right turn movements temporarily prohibited along Jarvis Street. As a result, current traffic volumes along Jarvis Street and Mutual Street are expected to be non-representative of typical conditions. As such, traffic counts for the affected intersections were taken from previous studies done by LEA, with data for the affected intersections dating November 2017. A growth factor was applied to through volumes for these intersections (growth rate discussed in Section 3.1) to project volumes to year 2018.

2.6 EXISTING INTERSECTION CAPACITY ANALYSIS

The existing intersection capacity analysis was undertaken using Synchro 9.1 which is based on the Highway Capacity Manual (HCM) 2000 methodology, with the input parameters adhering to the City of Toronto Transportation Impact Study and Synchro Guidelines. The existing traffic volumes in the study area during the weekday peak hours are illustrated **Figure 2-4**.

Figure 2-4: Existing Traffic Volumes



The existing intersection capacity analyses for the signalized and unsignalized intersections are summarized in **Table 2-2** and **Table 2-3**, respectively. Detailed Synchro reports are provided in **Appendix C**.

Table 2-2: Existing Intersection Capacity Analysis (Signalized)

Intersection	Movement	AM Peak Hour								PM Peak Hour							
		Overall			Movements					Overall			Movements				
		V/C	Delay (s)	LOS	V/C	Delay (s)	LOS	Queue (m)		V/C	Delay (s)	LOS	V/C	Delay (s)	LOS	Queue (m)	
								50th	95th							50th	95th
Shuter Street & Jarvis Street	EBL	0.69	19.2	B	0.37	25	C	5	16	0.65	21.9	C	0.74	45	D	17	#45
	EBTR				0.29	18	B	16	30				0.84	37	D	62	#113
	WBL				0.16	17	B	5	13				0.24	23	C	3	10
	WBTR				0.82	33	C	61	#111				0.67	28	C	43	71
	NBLTR				0.61	16	B	32	48				0.52	13	B	29	40
	SBLTR				0.56	15	B	35	46				0.31	11	B	11	19
Queen Street & Jarvis Street	EBTR	0.56	17.3	B	0.30	18	B	15	25	0.64	21.3	C	0.58	25	C	33	49
	WBTR				0.66	23	C	48	66				0.79	31	C	48	#71

	SBTR				0.48	15	B	34	44				0.12	9	A	6	10

- 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

The existing signalized intersection capacity analysis indicates that all signalized intersections are operating at an acceptable overall Level of Service (LOS) 'C' or better during the weekday AM and PM peak hours, with all individual movements operating within capacity.

Table 2-3: Existing Intersection Capacity Analysis (Unsignalized)

	SBLT	0	0	0.00	A	1	0	0.00	A
Richard Bigley Lane & Harbour Light Lane	EBLT	6	0	0.00	A	4	0	0.00	A
	SBLR	8	0	0.00	A	8	0	0.01	A

Most unsignalized intersections within the study area are operating generally operating well under existing traffic conditions, with all individual movements operating within capacity during both peak hours.

The exceptions are the southbound left-turn and the shared southbound through-left-right movements for the intersections of Queen Street East / Mutual Street and Shuter Street/Mutual Street, which are considered constrained under existing conditions during the PM peak hour, as they currently operate at LOS 'F', with an average delay of 56 to 65 seconds per vehicle. It is noted that these outputs are considered conservative as Synchro does not consider the metering that results from the nearby signalized intersections at Church Street and Jarvis Street along Queen Street/Shuter Street. However, it is noted that is typical to experience long delays for left turns from a minor roadway to a major roadway at unsignalized intersections in downtown Toronto.

3 FUTURE BACKGROUND TRAFFIC CONDITIONS

For the analysis of the future background traffic conditions, this study considers a five-year study horizon to year 2023, as confirmed with the City. To determine future background traffic conditions, two components of traffic growth were considered, which are general corridor growth and background developments within the study area.

3.1 CORRIDOR GROWTH

As confirmed with the City, an annual growth rate of 0.5 percent per year was applied along Queen Street East, Shuter Street, Mutual Street and Jarvis Street, based on traffic studies completed by LEA for developments in the area, including 79-85 Shuter Street (September 2017), and 60,64 Queen Street East and 131,133,135 Church Street (January 2018).

3.2 BACKGROUND DEVELOPMENT

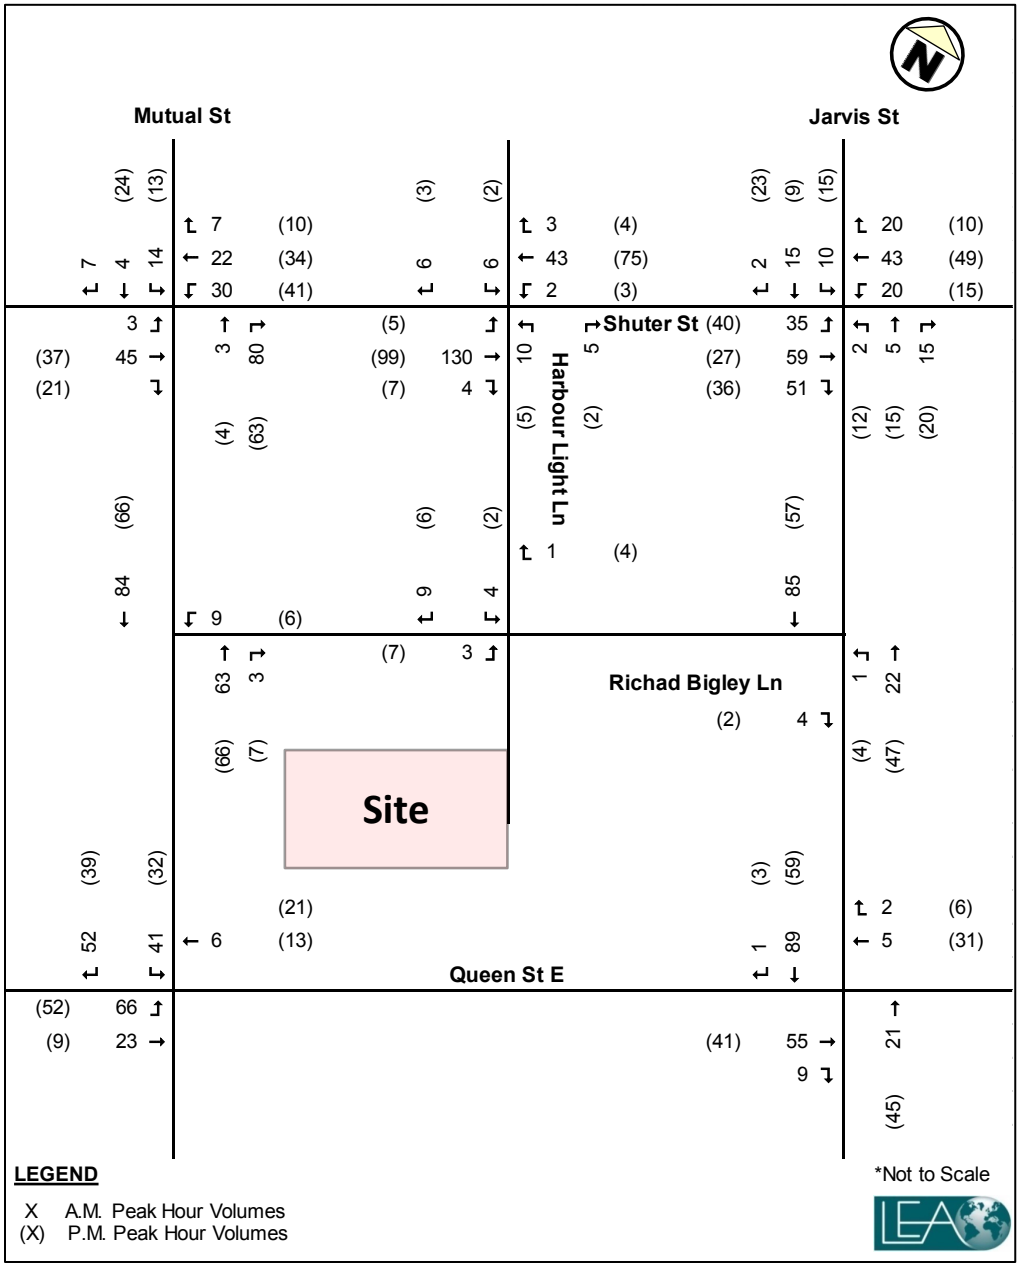
Based on discussion with City staff, nine background developments have been identified within the surrounding study area. Detailed information regarding the background developments are summarized **Table 3-1**.

Table 3-1: Summary of Background Developments

#	Address of Development	Description	Application Status
1	60 Shuter Street	29-storey mixed-use building (328 residential units and 487m^2 of retail)	NOAC Issued
2	79 Shuter Street	32-storey residential building (234 units)	Under Review
3	60 Queen Street E	54-storey mixed-use building (364 residential units and ground-floor retail)	Under Review
4	88 Queen Street E	Four (4) mixed-use buildings (1,139 residential units, 2,241m^2 of retail and 8,344m^2 of hotel)	OPA Approved by Council
5	59 Mutual Street	32-storey residential building (275 units)	Under Review
6	75 Mutual Street	36-storey mixed-use building (385 residential units, 285m^2 of retail and 509m^2 of office)	OMB Appeal
7	139 Church Street	49-storey mixed-use building (414 residential units and 480m^2 of ground-floor retail)	Under Review
8	215 Church Street	Multi-storey mixed-use building (604 residential units and ground-floor retail)	NOAC Issued
9	203 Jarvis Street	35-storey mixed-use building (222 residential units and 241 hotel rooms)	OMB Appeal

The Traffic Impact Studies (TIS) for each development were obtained from the City of Toronto to extract the forecasted site traffic volumes, and to assign them to the study area road network. The total background development traffic volumes are illustrated in **Figure 3-1**.

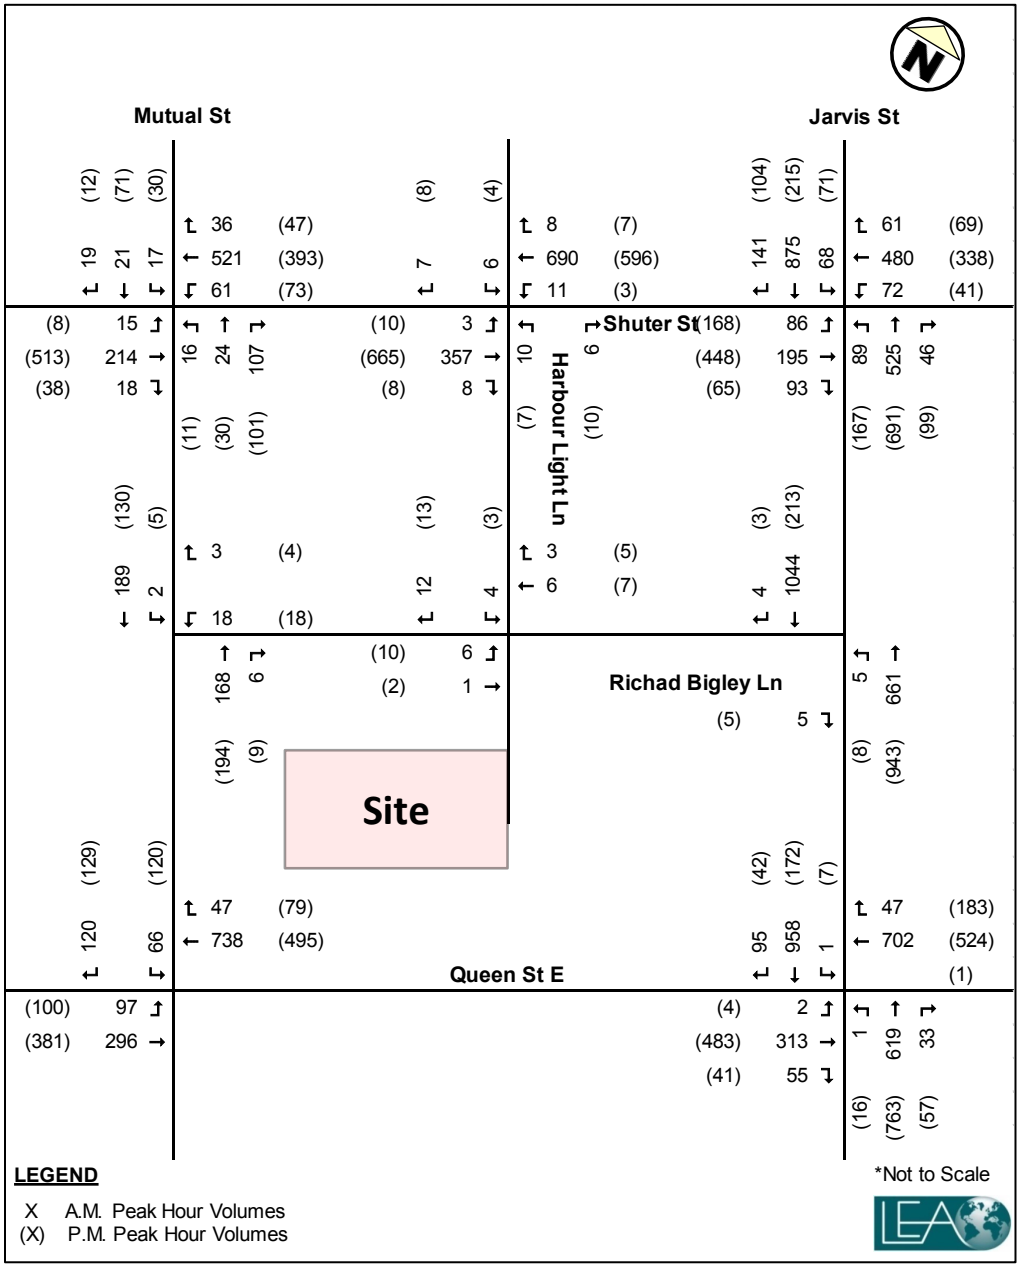
Figure 3-1: Background Development Site Traffic



3.3 FUTURE BACKGROUND INTERSECTION CAPACITY ANALYSIS

The future background traffic volumes for the 2023 horizon were determined by incorporating future background traffic due to growth and adding the background development site traffic to the existing traffic volumes. The future background traffic volumes are illustrated in **Figure 3-2**.

Figure 3-2: Future Background Traffic Volumes



The future background intersection capacity analyses for the signalized and unsignalized intersections are summarized in **Table 3-2** through **Table 3-5**. Detailed Synchro reports are provided in **Appendix D**.

Table 3-2: Future Background Intersection Capacity Analysis (Signalized)

Intersection	Movement	AM Peak Hour								PM Peak Hour							
		Overall			Movements					Overall			Movements				
		V/C	Delay (s)	LOS	V/C	Delay (s)	LOS	Queue (m)		V/C	Delay (s)	LOS	V/C	Delay (s)	LOS	Queue (m)	
								50th	95th							50th	95th
Shuter Street & Jarvis Street	EBL	0.78	25.1	B	0.86	80	E	11	#38	0.82	36.9	D	1.21	166	F	~31.8	#68
	EBTR				0.49	22	C	28	50				0.98	59	E	75	#138
	WBL				0.28	20	B	7	17				0.56	46	D	5	#21
	WBTR				0.94	48	D	74	#135				0.78	33	C	53	#98
	NBLTR				0.66	18	B	35	53				0.58	14	B	33	44
	SBLTR				0.60	15	B	37	50				0.40	12	B	14	24
Queen Street & Jarvis Street	EBTR	0.60	17.9	B	0.38	19	B	20	31	0.69	23.0	C	0.65	26	C	38	56
	WBTR				0.68	24	C	50	70				0.86	35	D	55	#87
	NBTR				0.47	15	B	34	48				0.59	14	B	46	64
	SBTR				0.54	15	B	39	51				0.17	10	A	9	14

Note:# - 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Most movements under future background conditions are expected to operate within capacity and with acceptable delays; however, compared to existing conditions, various individual movements have deteriorated and are expected to operate close to capacity, due to the traffic generated by the many background developments considered within the study area. The eastbound left-turn movement at Shuter Street & Jarvis Street is expected to operate at a v/c ratio of 1.21 during the PM peak hour. As such, the signal timing plan at this intersection has been improved to increase the available capacity and reduce average delays. This was done by optimizing the splits within the signal timing plan parameters; the cycle length and offset remain unchanged. **Table 3-3** outlines the signal timing modifications proposed for the intersection of Shuter Street & Jarvis Street.

Table 3-3: Signal Timing Improvements (PM Peak Hour)

Intersection	Timing Plan	NB/SB Total Splits (s)	EB/WB Total Splits (s)
Shuter Street & Jarvis Street	Existing	45 / 45	31/31
	Optimized	38 / 38	38/38
	Net Change	-7 / -7	+7 / +7

An additional intersection capacity analysis has been completed for Shuter Street & Jarvis Street during the PM peak hour, after applying the recommended signal timing improvements. The resulting operations are summarized in **Table 3-4**.

Table 3-4: Future Background (Optimized) Intersection Capacity Analysis (Signalized)

Intersection	Movement	PM Peak Hour							
		Overall			Movements				
		V/C	Delay (s)	LOS	V/C	Delay (s)	LOS	Queue (m)	
								50th	95th
Shuter Street & Jarvis Street	EBL	0.74	22.4	C	0.75	38	D	21	#54
	EBTR				0.77	27	C	63	#114
	WBL				0.27	18	B	4	12
	WBTR				0.62	21	C	45	73
	NBLTR				0.70	20	C	41	55
	SBLTR				0.48	17	B	17	29

- 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

With the optimized signal timings, all movements are expected to operate well within capacity under future background (2023) conditions. It is emphasized that the signal timing improvements recommended herein are triggered by background development site traffic, assuming they are all approved based on the request densities, and not the subject site.

Table 3-5: Future Background Intersection Capacity Analysis (Unsignalized)

Intersection	Movement	AM Peak Hour				PM Peak Hour			
		Delay (s)	95th Queue (m)	V/C	LOS	Delay (s)	95th Queue (m)	V/C	LOS

	NBTL	0	0	0	A	0	0	0.01	A
Queen Street & Mutual Street	EBLT	6	3	0	A	7	5	0.18	A
	SBL	38	13	0	E	252	69	1.27	F
	SBR	10	4	0	B	20	13	0.38	C
Richard Bigley Lane & Mutual Street	WBLR	12	1	0	B	11	1	0.04	B
	SBLT	0	0	0	A	0	0	0.00	A
Richard Bigley Lane & Harbour Light Lane	EBLT	6	0	0	A	6	0	0.01	A
	SBLR	9	0	0	A	9	1	0.02	A

The future background unsignalized intersection capacity analysis indicates that the southbound shared through-left-right movement at Shuter Street / Mutual Street and the southbound left-turn movement at Queen Street / Mutual are expected to operate over capacity during the PM peak hour. These two movements were identified as constrained under existing conditions in Section 2.6, and operations have been exacerbated due to other developments in the area. Thus, these movements are expected to operate poorly regardless of the implementation of the subject site.

The adverse capacity analysis results can be attributed to the additional traffic added onto Shuter Street and Queen Street East, which further limits turning opportunities, as well as the additional trips added to the minor roadways (north/south) movements, which results in a greater number of vehicles attempting to conduct an already constrained movement (as identified in Section 2.6). Furthermore, Synchro assumes that all pedestrians walk in front of a vehicle when crossing the minor street, further limiting gap opportunities for turning vehicles in the minor roadway. Typically, courtesy gaps are provided at these intersections to allow vehicles to turn, or pedestrians walk behind turning vehicles as they attempt to turn onto the major roadway. This behaviour is illustrated in **Figure 3-3**.

Figure 3-3: Example of Pedestrian Crossing Behaviour (Yonge Street/Edward Street)

Moreover, the Synchro software does not account for upstream metering of unsignalized intersections, due to the presence of nearby signalized intersections at Church Street and Jarvis Street. This metering by the nearby signalized intersections creates further gap opportunities for vehicles turning from the minor roadway.

In addition, it is acknowledged that Synchro's unsignalized delay calculations, based on HCM 2000 methodology can be conservative. Synchro overestimates the time for vehicles to complete a turning movement at TWSC intersections. For the westbound approach Synchro's default parameters assume that it takes more than 7 seconds to make the left-turn and more than 6 seconds to make a right-turn for vehicles entering the major street.

Based on the above, the results presented in **Table 3-5** can be regarded as a conservative analysis, and are based on the assumption that the background developments are approved as requested. Nonetheless, as previously noted, long delays at two-way stop intersections are typical for the minor approaches in the downtown Toronto environment.

The future background conditions will be used as the baseline for evaluating the impact of the proposed development.

4 Site Generated Traffic

The proposed mixed-use development will introduce a residential tower containing a total of 356 units and 339 m^2 of retail. The following subsections discuss in detail the calculation, distribution and assignment of the site-generated single-occupant vehicle (SOV) trips.

4.1 AUTO TRIP GENERATION

As discussed in Section 3.2, nine background developments have been identified within the surrounding study area with similar land uses. A summary of the auto trip generation rates used in the traffic studies for those background developments are summarized in **Table 4-1**.

Based on the limited amount of proposed ground-floor retail (339 m^2), it is expected that the retail component will be ancillary to the residents of the development and immediate surrounding area. Therefore, the trip generation rates were only projected for the residential uses of the proposed development.

Table 4-1: Residential Auto Trip Generation Rates

#	Address of Development	AM Peak Hour			PM Peak Hour		
		In	Out	Total	In	Out	Total
1	60 Shuter Street	0.03	0.10	0.13	0.08	0.05	0.13
2	79 Shuter Street	0.04	0.11	0.15	0.08	0.05	0.13
3	60 Queen Street E	0.02	0.10	0.12	0.08	0.04	0.11
4	88 Queen Street E	0.03	0.10	0.13	0.08	0.05	0.13
5	59 Mutual Street	0.04	0.11	0.15	0.08	0.05	0.13
6	75 Mutual Street	Not Available					
7	139 Church Street	0.02	0.10	0.12	0.08	0.04	0.12
8	215 Church Street	0.04	0.11	0.15	0.08	0.05	0.13
9	203 Jarvis Street	0.01	0.05	0.06	0.04	0.03	0.07
Average Residential Trip Rates* (trips/residential unit)		**0.03**	**0.10**	**0.13**	**0.08**	**0.05**	**0.12**

*Trip Rate of In and Out directions may not add up to the total due to rounding.

The average residential auto trip rate of the nine developments is 0.13 trips/residential unit in the AM peak period and 0.12 trips/residential unit in the PM peak period. As confirmed with the City, applying these rates to the proposed development is appropriate. The resulting subject site trip generation is summarized in **Table 4-2**.

Table 4-2: Auto Residential Trip Generation of the Subject Site

Proposed Development			AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Residential	356 units	Trip Rate	0.03	0.10	0.13	0.08	0.05	0.12
		Total Auto Trips	**11**	**35**	**46**	**27**	**16**	**43**

As shown in **Table 4-2**, the proposed development is expected to generate 46 two-way auto trips (11 inbound and 35 outbound) during the AM peak hour, and 43 two-way auto trips (27 inbound and 16 outbound) in the PM peak hour. We note that given the proposed parking supply of 44 parking spaces, this trip generation is deemed conservative.

4.2 AUTO TRIP DISTRIBUTION AND ASSIGNMENT

Directional trip distribution of site traffic was derived using Transportation Tomorrow Survey (TTS) 2016 data. The estimated trip distribution for this study is outlined in **Table 4-3**. The site traffic was assigned to the road network based on trip patterns in the study area, location and configuration of the site accesses, and the route providing the shortest travel time.

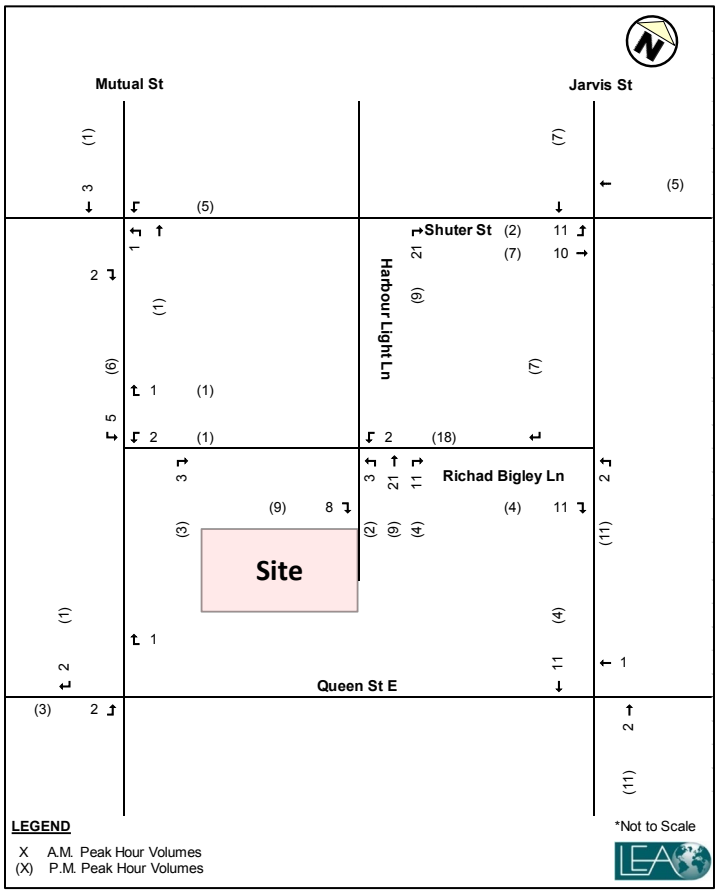
Table 4-3: Subject Site Trip Distribution

Direction	AM Peak Hour		PM Peak Hour	
	In	Out	In	Out
NB on Jarvis	0%	32%	27%	15%
SB on Jarvis	20%	31%	41%	27%
NB on Mutual	27%	0%	3%	9%
EB on Queen	12%	0%	0%	2%
WB on Queen	24%	6%	9%	4%
EB on Shuter	0%	29%	20%	42%
WB on Shuter	17%	2%	0%	0%
Total*	**100%**	**100%**	**100%**	**99%**

*Total may not add up to 100% due to rounding.

The site traffic volumes for the weekday AM and PM peak hours are illustrated in **Figure 4-1**. Conservatively, traffic generated by the existing uses was not deleted from the projected site traffic.

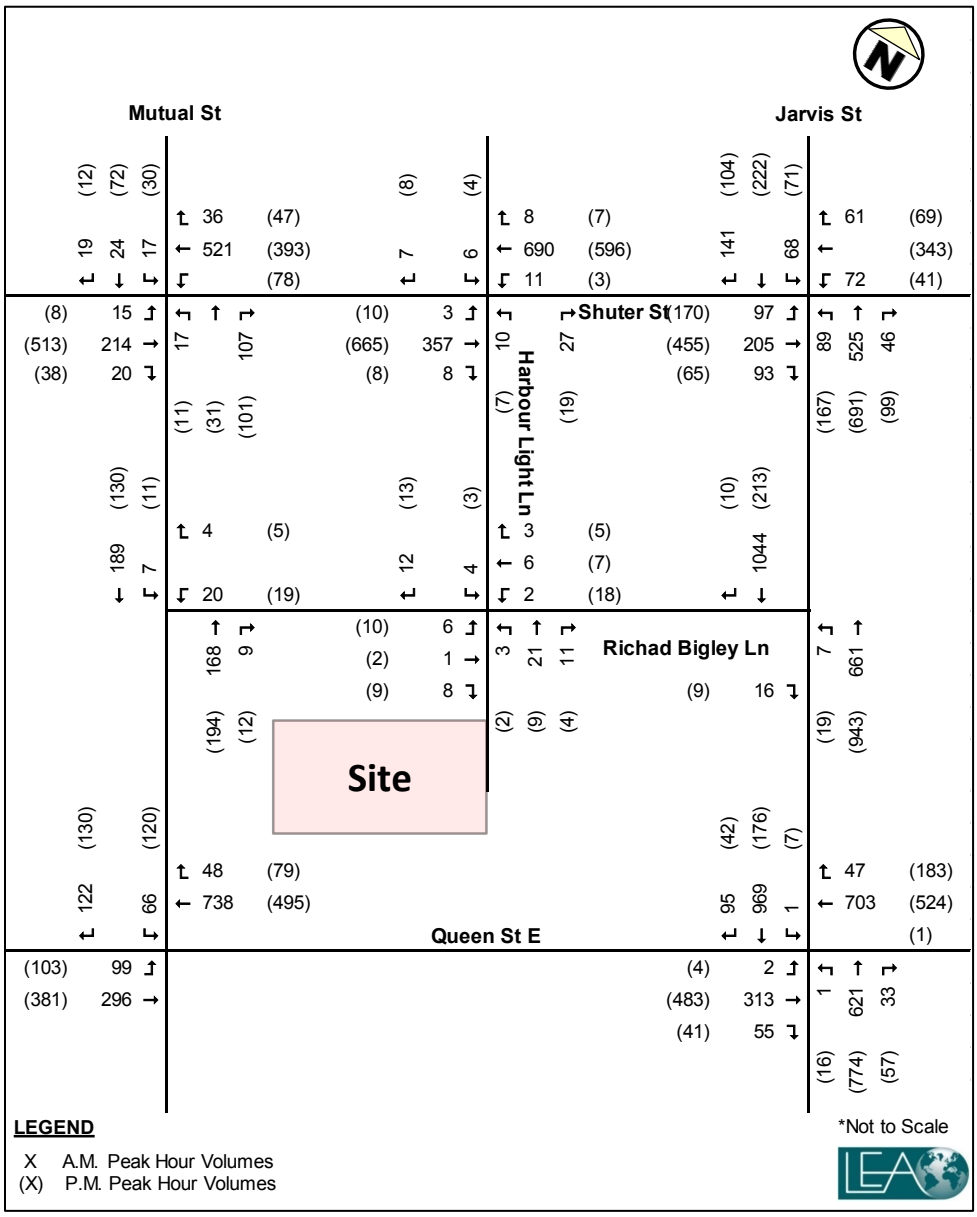
Figure 4-1: Site Traffic Volumes



5 FUTURE TOTAL TRAFFIC CONDITIONS

The future total traffic volumes were estimated by superimposing the site-generated traffic volumes illustrated in **Figure 4-1** onto the future background traffic volumes in **Figure 3-2**. The resulting future total traffic forecasts are illustrated in **Figure 5-1**.

Figure 5-1: Future Total Traffic Volumes



The future total intersection capacity analyses for the signalized and unsignalized intersections are summarized in **Table 5-1** and **Table 5-2** respectively. Detailed Synchro reports are provided in **Appendix E**. The signal timing improvements proposed under future background conditions have been carried forward into the future total analysis.

Table 5-1: Future Total Intersection Capacity Analysis (Signalized)

Intersection	Movement	AM Peak Hour								PM Peak Hour							
		Overall			Movements					Overall			Movements				
		V/C	Delay (s)	LOS	V/C	Delay (s)	LOS	Queue (m)		V/C	Delay (s)	LOS	V/C	Delay (s)	LOS	Queue (m)	
								50th	95th							50th	95th
Shuter Street & Jarvis Street	EBL	0.79	26.3	C	0.97	105	F	14	#43	0.74	22.7	C	0.77	40	D	21	#56
	EBTR				0.51	22	C	30	52				0.78	27	C	64	#116
	WBL				0.28	20	B	7	17				0.27	18	B	4	12
	WBTR				0.94	48	D	74	#135				0.62	21	C	45	75
	NBLTR				0.66	18	B	35	53				0.70	20	C	41	55
	SBLTR				0.60	15	B	37	50				0.48	18	B	18	30
Queen Street & Jarvis Street	EBTR	0.61	17.9	B	0.38	19	B	20	31	0.70	23.0	C	0.65	26	C	38	56
	WBTR				0.69	24	C	50	70				0.86	35	D	55	#87
	NBTR				0.48	15	B	34	48				0.60	14	B	47	65
	SBTR				0.55	15	B	40	52				0.17	10	A	9	15

- 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

The future total signalized intersection capacity analysis indicates that all signalized intersections are expected to operate at an acceptable overall LOS during all peak hours, with all individual movements operating within capacity. Traffic operations under future total conditions are very similar to future background conditions; all intersections are expected to continue operating at a similar LOS with minimal increases in V/C ratios.

Table 5-2: Future Total Intersection Capacity Analysis (Unsignalized)

Intersection	Movement	AM Peak Hour				PM Peak Hour			
		Delay (s)	95th Queue (m)	V/C	LOS	Delay (s)	95th Queue (m)	V/C	LOS
Shuter Street & Mutual Street	EBLTR	1	0	0.02	A	0	0	0.01	A
	WBLTR	2	1	0.06	A	3	3	0.10	A
	NBLTR	20	14	0.40	C	73	42	0.80	F
	SBLTR	38	12	0.37	E	423	78	1.61	F
Shuter Street & Harbour Light Lane	EBLTR	0	0	0.00	A	0	0	0.02	A
	WBLTR	0	0	0.01	A	0	0	0.00	A
	NBLTR	22	4	0.15	C	33	5	0.17	D
	SBLTR	32	2	0.09	D	37	3	0.10	E
Richard Bigley Lane & Jarvis Street	EBLR	11	1	0.03	B	11	0	0.02	B
	NBTL	1	0	0.01	A	1	1	0.02	A
Queen Street & Mutual Street	EBLT	6	3	0.13	A	7	5	0.18	A
	SBL	38	13	0.39	E	260	70	1.29	F
	SBR	10	4	0.16	B	20	13	0.38	C
Richard Bigley Lane & Mutual Street	WBLR	12	1	0.06	B	11	1	0.04	B
	SBLT	0	0	0.01	A	1	0	0.01	A
Richard Bigley Lane & Harbour Light Lane	EBLT	6	0	0.00	A	6	0	0.01	A
	SBLR	9	0	0.02	A	9	1	0.02	A

The future total traffic conditions at the unsignalized intersections are very similar to the future background traffic conditions in **Table 3-5**. The addition of site-generated traffic results in marginal increases in average

delay and v/c ratio. The results continue to indicate capacity issues for the southbound through-left-right movement at Shuter Street & Mutual Street and the southbound left-turn movement at Queen Street & Mutual; however operations are very similar to future background conditions, indicating the site has a minimal impact on these movements. As noted previously, the Synchro model is deemed conservative due its assumed pedestrian behaviour, its high gap acceptance times, and as it does not account upstream intersection metering. The v/c ratios for the aforementioned critical movements have marginally increased from 1.54 to 1.61 and from 1.27 to 1.29 respectively. The total volumes of all legs at Shuter Street / Mutual Street has increased from 1327 to 1334 vehicles per hour (approximately 0.5 percent) after the addition of site-generated traffic; this is a negligible increase. Similarly, the total volumes of all legs at Queen Street / Mutual Street has increased from 1304 to 1308 vehicles per hour (approximately 0.3 percent). Thus, the addition of site-generated traffic has minimal impacts to the surrounding unsignalized intersections.

It should also be noted that the site-generated traffic does not result in any new critical movements. The remaining unsignalized intersections all operate at an acceptable LOS and within capacity during both peak hours.

Based on the above-noted and our comparison in traffic operations between Background Conditions and Total Conditions, it is concluded that the proposed development will have minimal traffic impacts on the study area intersections.

6 TRANSIT ASSESSMENT

6.1 EXISTING TRANSIT CAPACITY ANALYSIS

The existing transit capacity analysis has been conducted using data received from the TTC for TTC Route 501 – Queen (data was collected in 2006), 502 – Downtowner (Data was collected in 2014) and 141 - Downtown/Mt Pleasant Express (data was collected in 2012). The TTC Route data can be found in **Appendix F**. To account for growth since the time data was collected, an annual growth rate of 1.7 percent has been calculated based on TTC overall ridership from 2006 to 2017. For a conservative approach, an annual growth rate of 2 percent has been applied. The existing transit capacity analyses are summarized in **Table 6-1**.

Table 6-1: Existing Transit Capacity Analysis

Routes	Direction	Location	Peak Hour	Capacity	Departure Demand	Departure % Utilization	Arrival Demand	Arrival % Utilization
501 Queen	EB	Queen/Jarvis	AM Peak	1433	561	39%	614	43%
501 Queen	WB	Queen/Jarvis		1535	1215	79%	1211	79%
502 Downtowner*	EB	Queen/Jarvis		370	97	26%	108	29%
502 Downtowner*	WB	Queen/Jarvis		370	354	96%	354	96%
141 Downtown/ Mt Pleasant	SB	Jarvis/Queen		265	77	49%	78	49%
501 Queen	EB	Queen/Jarvis	PM Peak	1126	1045	93%	1070	95%
501 Queen	WB	Queen/Jarvis		1228	665	54%	651	53%
502 Downtowner*	EB	Queen/Jarvis		370	271	73%	265	72%
502 Downtowner*	WB	Queen/Jarvis		370	90	24%	89	24%
141 Downtown/ Mt Pleasant	NB	Jarvis/Queen		106	28	26%	28	26%

* - Since TTC Route 502 – Downtowner was serviced by streetcar in 2014, the capacity was derived based on service summary from November 22, 2015 to January 2, 2016 (latest available data before service replaced by bus).

As shown in **Table 6-1**, all routes operate within capacity during both AM and PM peak hours under existing conditions, no capacity constraints have been identified. It is noted that Route 502 Downtowner – westbound direction – is close to capacity during the AM peak, and Route 501 Queen – eastbound direction – is close to capacity in the east direction during the PM peak.

6.2 FUTURE BACKGROUND TRANSIT CAPACITY ANALYSIS

The transit capacity analysis assumes the existing transit network is in place by 2023. It is noted that the planned rollout of the new Flexity streetcars has been assumed within this study's planning horizon year of 2023 for the Route 501 – Queen and 502 – Downtowner. The new streetcars are expected to increase the route capacity due to their larger crush capacity. These assumptions have been incorporated into the analysis.

The future background transit capacity analysis involves the trips evaluated under existing conditions, plus the addition of a growth rate over five-year planning horizon of this study. A growth rate of 2 percent has been applied, as noted above. The future background transit capacity analyses are summarized in **Table 6-2**.

Table 6-2: Future Background Transit Capacity Analysis

Routes	Direction	Location	Peak Hour	Capacity	Departure Demand	Departure % Utilization	Arrival Demand	Arrival % Utilization
501 Queen	EB	Queen/Jarvis	AM Peak	1820	619	34%	678	37%
501 Queen	WB	Queen/Jarvis		1950	1341	69%	1337	69%
502 Downtowner	EB	Queen/Jarvis		650	107	17%	119	18%
502 Downtowner	WB	Queen/Jarvis		650	391	60%	391	60%
141 Downtown/ Mt Pleasant	SB	Jarvis/Queen		159	85	54%	87	54%
501 Queen	EB	Queen/Jarvis	PM Peak	1430	1154	81%	1181	83%
501 Queen	WB	Queen/Jarvis		1560	734	47%	719	46%
502 Downtowner	EB	Queen/Jarvis		650	299	46%	292	45%
502 Downtowner	WB	Queen/Jarvis		650	99	15%	98	15%
141 Downtown/ Mt Pleasant	NB	Jarvis/Queen		106	31	29%	31	29%

As shown in **Table 6-2,** all routes are expected to operate within capacity during both AM and PM peak hours under future background conditions, with no capacity constraints identified.

6.3 TRANSIT TRIP GENERATION AND DISTRIBUTION

To determine the anticipated transit trips generated by the proposed residential uses on the subject site, the auto trip generation rates were used and factored to the transit modal split in the area to estimate transit trip generation. TTS 2016 data reveals that the auto mode split in the area is approximately 14%, while transit modal split is estimated to be approximately 27% during AM peak hour, as shown in **Table 6-3**. Further details are provided in **Appendix G**.

Table 6-3: Modal Split

Auto Driver	Auto Passenger	Transit	Walk	Cycle	Other	Total
14%	2%	27%	54%	4%	0%	100%

*Percentage may not add up to the total due to rounding.

The residential auto trip generation rates (Table 4.2) have therefore been used to calculate the transit trip generation using this modal split data. **Table 6-4** below summarizes the transit trip generation rates and transit trip generation for the subject site.

Table 6-4: Transit Trip Generation of the Subject Site

Proposed Development			AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Residential	356 units	Trip Rate*	0.06	0.19	0.25	0.15	0.09	0.24
		Total Transit Trips	**21**	**68**	**89**	**53**	**32**	**85**

*Trip Rate of In and Out directions may not add up to the total due to rounding.

6.4 FUTURE TOTAL TRANSIT CAPACITY ANALYSIS

The future total transit capacity analysis involves the addition of the transit trips generated by the subject site to the future background transit condition. **Table 6-5** below summarizes the future total transit capacity analysis.

Table 6-5: Future Total Transit Capacity Analysis

Routes	Direction	Location	Peak Hour	Capacity	Departure Demand	Departure % Utilization	Arrival Demand	Arrival % Utilization
501 Queen	EB	Queen/Jarvis	AM Peak	1820	630	35%	690	38%
501 Queen	WB	Queen/Jarvis		1950	1373	70%	1340	69%
502 Downtowner	EB	Queen/Jarvis		650	121	19%	123	19%
502 Downtowner	WB	Queen/Jarvis		650	402	62%	393	60%
141 Downtown/ Mt Pleasant	SB	Jarvis/Queen		159	85	54%	87	54%
501 Queen	EB	Queen/Jarvis	PM Peak	1430	1166	82%	1214	85%
501 Queen	WB	Queen/Jarvis		1560	751	48%	734	47%
502 Downtowner	EB	Queen/Jarvis		650	304	47%	294	45%
502 Downtowner	WB	Queen/Jarvis		650	101	16%	100	15%
141 Downtown/ Mt Pleasant	NB	Jarvis/Queen		106	31	29%	31	29%

As shown in **Table 6-5**, with the addition of the site transit trips, very minor increases in departure and arrival utilization are noted for all routes. All routes are expected to continue operating within capacity. Thus, the subject site is expected to have insignificant impacts on the nearby transit routes.

It is worth noting that further design work of the Relief Line South is currently underway. The latest alignment which was approved by the City would be running from Pape to Downtown via Queen/Richmond. The nearest station along the latest alignment would be located at Queen Street & Sherbourne Street, approximately 400 metres from the subject site. Although the exact year of construction/completion is still to be determined, the Relief Line South were implemented, it would provide an alternative transit option for the subject site in the future.

7 PARKING

7.1 VEHICULAR PARKING

7.1.1 Vehicle Parking Requirements

The subject site is governed by the City of Toronto Zoning By-law 569-2013, Policy Area 1. Therefore, the minimum vehicular parking requirements for the proposed development are evaluated using applicable parking standards from the aforementioned By-law. The parking requirements for the proposed development, as well as the proposed parking supply, are summarized in **Table 7-1**.

Table 7-1: Minimum Vehicle Parking Requirement

Proposed Use	No. of Units/GFA	City of Toronto By-law 569-2013		Proposed Supply (Rate)	
		Minimum Parking Requirement Rate	Parking Spaces Required	Physical Supply	Effective Supply based on 6 Car-Share Spaces
Residential	356	-	-	34 (including six car-share spaces)	51 (0.14 spaces per unit)
Bachelor	65 units	0.3 spaces / unit	19	-	-
1-bedroom	150 units	0.5 spaces / unit	75	-	-
2-bedroom	105 units	0.8 spaces / unit	84	-	-
3-bedroom	36 units	1.0 spaces / unit	36	-	-
Visitors	356 units	0.1 spaces / unit	35	10	10 (0.03 spaces per unit)
Retail	339 m^2	None*	0	0	0
Total			**249**	**44**	**61 (0.17 spaces per unit)**

* As per By-law 569-2013 Section 200.5.200.40 (4), in a CR zone in Policy Area 1, no parking spaces are required for retail uses, if the interior floor area of all these uses does not exceed 1.0 times the area of the lot.

A total of 249 parking spaces are required based on the minimum parking requirements of the Zoning By-law 569-2013. When incorporating the car share reduction, the physical supply of 34 residential parking spaces (including six car-share spaces) is equivalent to providing a total of 51 residential spaces (0.14 spaces/unit). Details on the car-share reduction are further discussed in section 7.1.6. Visitor parking spaces are proposed to be supplied at a rate of 0.03 spaces per unit, consisting of 10 visitor parking spaces. With an effective parking supply of 61 spaces, the proposed development will still be 188 deficient of the By-law.

However, there are several similar developments in the surrounding area that have adopted a similar or lower parking rates. Given the parking supply deficiency, the following subsections will provide justification for the proposed parking rates.

7.1.2 Observed Proxy Parking Rates

LEA conducted two parking demand surveys of residential developments at 155 Dundas Street East and 8 Mercer Street. The first survey (155 Dundas Street East) was conducted between 5:00 AM and 1:00 AM on Wednesday August 31, Thursday September 8 and Wednesday September 14 of 2016. The parking spaces were counted every hour during the survey and the parking occupancy was recorded for each parking space individually. The second survey (8 Mercer Street) was conducted between midnight and 2:00 AM on

Wednesday February 10 and Friday February 12 of 2016, and between midnight and 3:00 AM on January 15, 2016. The parking spaces were counted every half hour during the survey and parking occupancy was recorded for each parking space individually.

These proxy sites are located in very similar transportation contexts, close to the TTC subway Line 1 and surface transit, and active transportation facilities, and near a multitude of employment, retail, and institutional uses, all conveniently located within walking distance. The observed parking demand rates are summarized in **Table 7-2**. Detailed survey results are provided in **Appendix H**.

Table 7-2: Observed Parking Demand Rates at Proxy Site

Residential Parking Demand Rates			
Proxy Development	# Of Units	Maximum Parking Demand	Rate (Spaces / Unit)
8 Mercer Street	412	72	0.17
155 Dundas Street East	377	39	0.10
Subject Site	**356**	**-**	**0.14**

Given the similarity in the development type and the transit, cycling and pedestrian facilities between these sites and the subject site, the low parking supply rates observed at these sites provides indicate that the proposed parking supply can meet the expected parking demand, and thus these rates are supportive of the proposed parking reduction for the subject site.

7.1.3 Observed Parking Rates at Similar Developments

LEA has also reviewed approved parking supplies at other residential developments in the vicinity of the subject site. The evaluation concluded that the approved parking supply at various sites are similar to the proposed parking supply at the subject site. The approved parking supply rates of various developments are summarized in Table 7-3.

Table 7-3: Approved Residential Parking Supply Rates of Various Developments in the Area

Site Address	# of Units	Approved Parking Supply Rate
9-21 Grenville Street	495	0.21
426 University Avenue	315	0.03
485-495 Wellington Street West	136	0.18
32 Camden Street	87	0.13
70 Temperance Street	798	0.10
40-58 Widmer Street	426	0.21
Average Approved Residential Parking Supply Rate		**0.14**
Proposed Parking Supply Rate		**0.14**

Evidently, lower residential parking supply rates are becoming common in the Downtown Toronto area. The average parking supply rate of nearby approved developments is 0.14, which is equal to the proposed residential parking rate of 0.14 for the subject site.

7.1.4 Boundary Transportation Network

The transportation network of the surrounding area features a robust and diverse transportation network with many different modes of transportation readily available. As mentioned in Section 2.2, there are several transit options that exist within walking distance of the subject site. The proposed development is located within a transit-oriented development environment and therefore a high auto usage is neither expected nor recommended. Furthermore, the existing pedestrian network provides good connections between the residential and commercial uses in the area as well as the nearby TTC bus/streetcar stops and Queen subway station as summarized in Section 2.2. Lastly, a notable cycling network exists in the surrounding area of the subject site. Section 2.3 summarizes the available cycling infrastructure travelling in both the east-west and north-south direction.

Given that the subject site's area features good pedestrian and cycling network, with excellent access to transit options, this relieves the necessity of owning a vehicle. Thus, the proposed parking supply is deemed appropriate given the transportation context of the area.

Based on our assessment which included parking survey data, a review of parking rates approved in the vicinity, and a review of the transportation context area in vicinity of the subject site, we conclude that the proposed residential parking supply of 34 parking spaces, which includes six car-share spaces (effective parking supply of 51 residential parking spaces), is appropriate to accommodate the parking demand of the subject site.

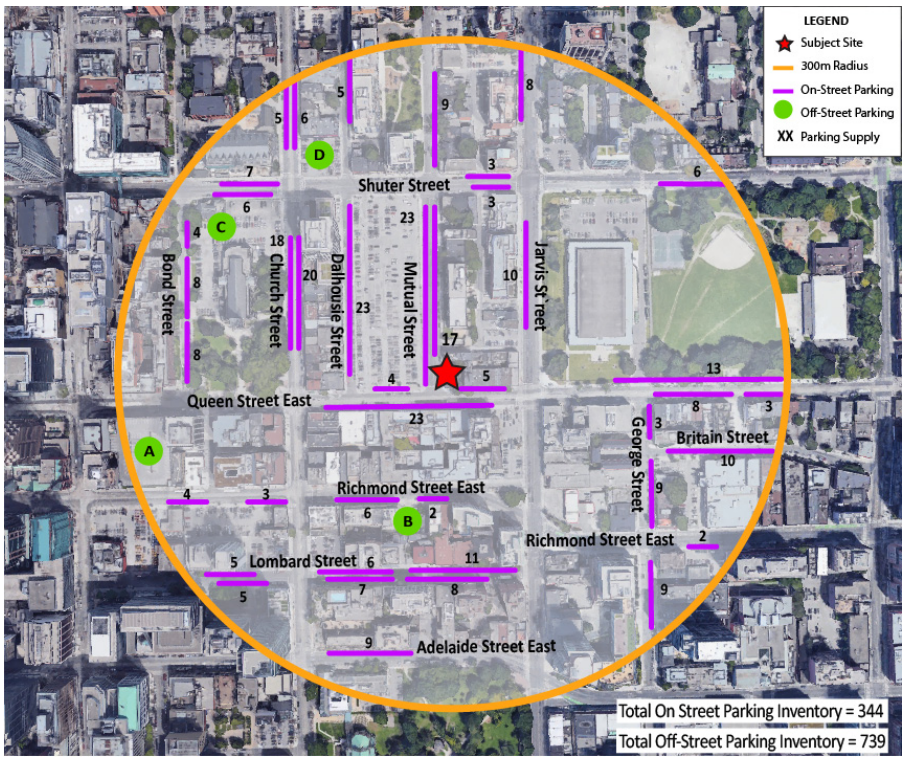
7.1.5 Visitor Parking Reduction

A total of 10 visitor parking spaces are proposed on-site. This reflects a deficiency of 25 visitor parking spaces from the By-law requirements. However, the abundance of public parking options available immediately surrounding the site is expected to adequately accommodate the visitor parking demand generated by the subject site. The available off-site public parking facilities are summarized in **Table 7-4** and both the on-street and off-street facilities are illustrated in **Figure 7-1**. An on-street and off-street public parking supply of 344 spaces and 739 spaces, respectively, exists within a 300-metre radius of the subject site. This abundance of nearby public parking sufficiently offsets the visitor parking deficiency.

Table 7-4: Off-Street Public Parking Facilities

Map Label	Location	Provider	Type	Parking Supply
A	37 Queen Street East	Green P	Garage	645
B	87 Richmond Street	Green P	Surface	20
C	51 Bond Street	Impark	Garage	34
D	206 Church Street	Canada Auto Parks	Surface	40
			TOTAL	739

Figure 7-1: Available Public Parking Facilities



Based on our review, there is an abundance of public parking supply in the surrounding area; therefore, the remaining 25 visitor parking spaces required for the proposed development can be accommodated through on-street parking of public parking facilities in the area.

7.1.6 Car-Share Spaces

There has been a recent increase in the provision of car share spaces with new condominium developments within the Greater Toronto Area (GTA). As per the *Parking Standards Review: Examination of Potential Options and Impacts of Car Share Programs on Parking Standards* report prepared by IBI Group in 2009 for the City of Toronto, one car share space can replace the demand of four resident spaces. The report also suggests providing car share spaces at the rate of one space per 60 residential units with a maximum reduction of 23 parking spaces. Therefore, six car share spaces are recommended for the proposed 356 units, which will replace the demand of 23 residential spaces. The resulting effective parking supply and parking ratio are summarized in **Table 7-5**.

Table 7-5: Effective Parking Supply

Level	Physical Parking Supply	Effective Parking Supply
P1	3	3
P1	6 car-share	= minimum ([6 x 4], 23) = 23
P2	22	22
P3	13	13
Total Supply (rate)	44 (0.12)	61 (0.17)

7.2 BICYCLE PARKING

The bicycle parking requirements for the subject site was reviewed based on the City's By-law 569-2013 and the Toronto Green Standards (v3). A summary of minimum bicycle parking requirement is provided in **Table 7-6**.

Table 7-6: Minimum Bicycle Parking Requirement

Land Use	No. of Units	City of Toronto By-law 569-2013		Proposed Bicycle Parking Supply
		Minimum Bicycle Parking Requirement Rate	Bicycle Spaces Required	
Residential	356	Long -Term: 0.9 spaces / unit	321	360
		Short-Term: 0.1 spaces / unit	36	36
		Total	**357**	**396**

Based on the architectural drawings provided, the proposed development will meet the minimum bicycle requirements.

8 LOADING

The loading requirements for the subject site was reviewed based on the City's Zoning By-law 569-25013. A summary of the minimum loading requirements is provided in **Table 8-1**.

Table 8-1: Minimum Loading Requirement

Land Use	Units/GFA	By-Law Requirement	Proposed Supply
Residential	356	1 Type "G"	1 Type "G"
Retail	339 m^2	None required if GFA <500 m^2	-

As presented in the above table, one Type "G" loading space is required for the proposed development. The proposed site plan indicated one Type "G" loading space, sufficiently satisfying the By-law requirement.

A site circulation assessment was completed using AutoTURN 9.1 software package to ensure adequate manoeuvrability through the site for both garbage and delivery trucks. The swept path diagrams are provided in **Appendix I**. Based on the swept path diagrams, the garbage and delivery trucks are able to enter and exit the proposed loading bay in an acceptable manner.

9 CONCLUSIONS

The subject site to be located at 90-104 Queen Street East, is currently occupied by four different mixed-use buildings with ground-floor commercial uses. The subject site is proposed to be redeveloped into a 34-storey plus wrapped mechanical penthouse mixed-use building containing 356 units, 339 m^2 of ground-floor retail and three underground parking levels. The underground parking will be accessed from Richard Bigley Lane.

Under existing traffic conditions, all movements at the studied intersections are operating within capacity during AM and PM peak hours. With the addition of background developments traffic volumes and signal timing optimization, all studied signalized intersections under the future background conditions are operating within capacity. However, the southbound shared through-left-right movement at Shuter Street / Mutual Street and the southbound left-turn movement at Queen Street / Mutual are expected to operate over capacity during the PM peak hour. It is noted that these capacity issues are trigged by background traffic and would occur regardless of the implementation of the proposed development. Synchro's default parameters for unsignalized intersections are quite conservative and significantly influence the V/C ratio. Furthermore, the software assumes that all pedestrians walk in front of a vehicle when crossing the stop-controlled minor street, further limiting gap opportunities for vehicles that are making turns on the minor street. In an urban environment, courtesy gaps are typically provided to allow vehicles to turn, or pedestrians walk behind turning vehicles while they are attempting to make their manoeuvre. Lastly, Synchro does not account for upstream metering of unsignalized intersections, due to the presence of nearby signalized intersections; this also inflates the V/C ratio. For these reasons, the capacity analyses results for the unsignalized intersections can be regarded as conservative.

The proposed development is expected to generate 46 and 43 two-way vehicle trips during the weekday AM and PM peak hours respectively. The expected site traffic was distributed based on TTS 2016 data.

The future total intersections capacity analysis indicates that the proposed development will have minimal impacts on the study area intersections, as the studied intersections are expected to operate similarly under background traffic conditions and total traffic conditions, during the weekday AM and PM peak hours. No intersection improvements are required to support the proposed residential development. It is noted that the signal timing optimization proposed under future background conditions is triggered by the background conditions and not the subject site traffic.

Transit capacity analyses were completed for the TTC Route 501 – Queen streetcar, Route 502 – Downtowner streetcar and Route 141 – Downtown/Mt Pleasant Express bus routes. All routes are expected to operate within capacity during AM and PM peak hours, with no capacity constraints identified, under the existing and future background conditions. Capacity improvements on Route 501 – Queen streetcar and Route 502 – Downtowner are expected in the future horizon (2023) with the planned rollout of the new Flexity streetcars.

The subject site is expected to generate 89 transit trips during both the weekday AM and PM peak hours. Minimal impacts on the streetcar and bus routes analyzed under future total conditions are expected.

A total effective vehicle parking supply of 61 spaces (0.17 spaces/unit) is proposed. However, the proximity of the subject site to various transit, cycling and pedestrian facilities provides viable travel alternatives to automobile trips. Furthermore, proxy site parking demand survey data supports the proposed parking rate at the subject site. Additionally, other approved parking rates for similar developments were reviewed and it was concluded that the average parking rates of these developments was lower to that being proposed by

the subject site. Lastly, the deficiency in visitor parking is met with the abundance of public parking facilities within a 300 m radius of the proposed development. On this basis, the parking supply at the subject site is deemed adequate.

A total bicycle parking supply of 396 spaces is proposed which meets the minimum requirements of City's By-law and Toronto Green Standard. Lastly, the loading review determined that the subject site will meet the City's loading requirements with the provision of one Type "G" loading space.

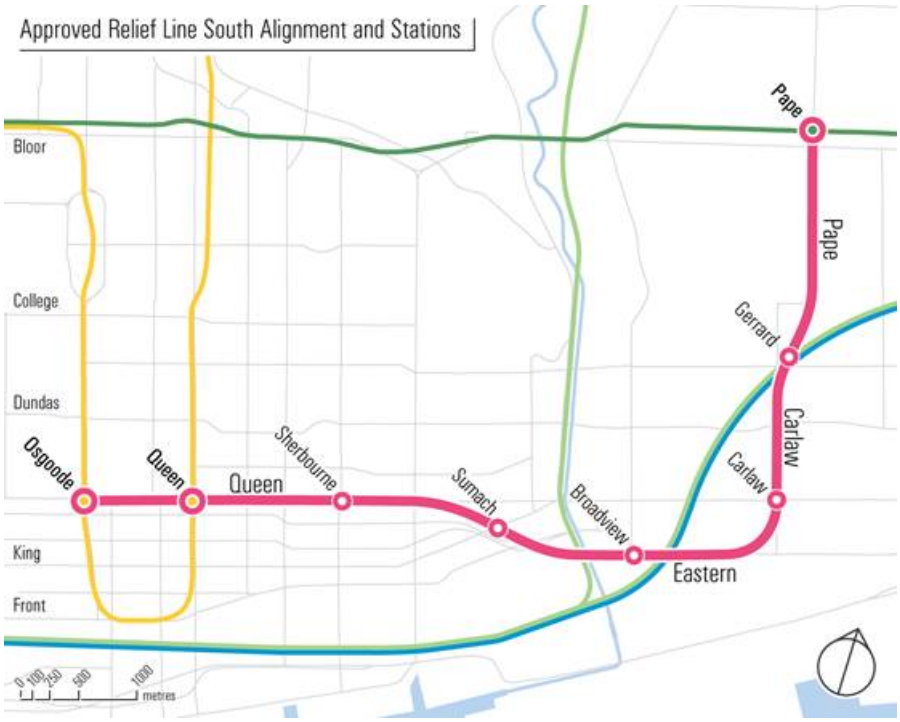
Subject: RE: 90-104 Queen Street East - Terms of Reference

Hello Timothy,
Your scope is satisfactory for matters under my purview. Please note that Tabassum Rafique may provide additional comments within the Transportation Services realm.



As a side note, the Relief Line South project is underway. This project is likely beyond your study's horizon year. The subway alignment will follow Queen Street. There is no subway stations planned in the near vicinity of your site. Nevertheless, things can change and you should always be aware of the project's latest news, which is available at: http://reliefline.ca/south/current-work

Regards,
Eddy

Subject: 90-104 Queen Street East - Terms of Reference

Dear Tabassum/Eddie,

We wish to confirm the following work plan for a Transportation Impact Assessment (TIA) for the proposed redevelopment located at 90-104 Queen Street East in the City of Toronto. The subject site is located at the northeast corner of Queen Street East and Mutual Street. The redevelopment will consist of a 33-storey residential building with ground floor retail. **Figure 1** below illustrates the subject site.

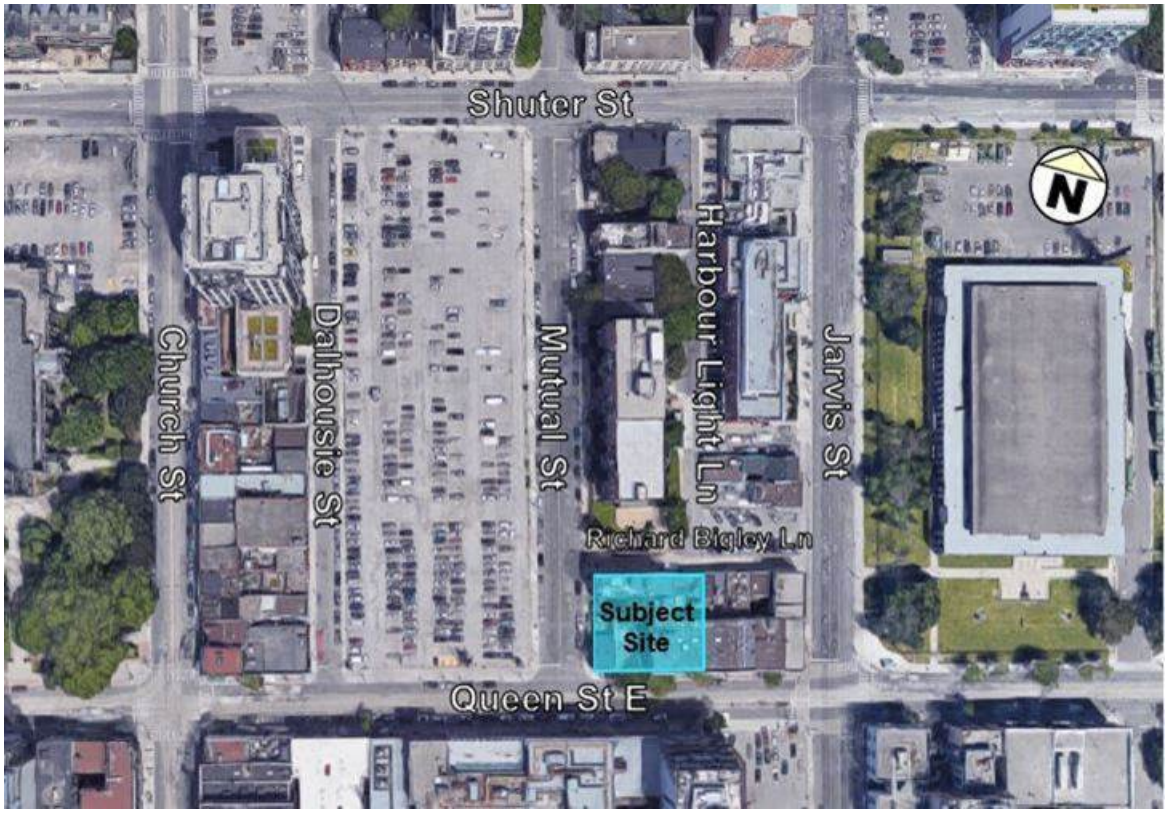

Figure 1: Subject Site

The Transportation Impact Study for the proposed redevelopment will be conducted following the ***City of Toronto Guidelines for the Preparation of Transportation Impact Studies***. The following outlines the proposed Terms of Reference for the Transportation Impact Study.

Proposed Development

It is our understanding that the proposed development will consist of a 33-storey residential building, ground floor retail and underground parking.

Study Area & Traffic Data

The TIS will assess weekday AM (7:00 to 9:00 a.m.) and PM (4:00 to 6:00 p.m.) peak hours. The proposed study area will include the analysis of the following intersections:

- Queen Street East & Jarvis Street (Signalized);
- Queen Street East & Mutual Street (Unsignalized);
- Shuter Street & Mutual Street (Unsignalized);
- Shuter Street & Harbour Light Lane (Unsignalized);
- Shuter Street & Jarvis Street (Signalized);
- Richard Bigley Lane & Harbour Light Lane (Unsignalized);
- Richard Bigley Lane & Mutual Street (Unsignalized); and
- Richard Bigley Lane & Jarvis Street (Unsignalized).

Turning movement counts at all intersections will be within the last 2 years.

Traffic Assessment and Study Horizon Year

The study will focus on weekday AM and PM peak hour traffic operations. Synchro version 9.0 will be used to assess intersection operations during the peak hours. The horizon year of 2023 will be assessed in this TIS.

Background Traffic

General Corridor Growth Rate – To be consistent with the TIS completed for 79-85 Shuter Street by LEA dated September 2017 and 60,64 Queen Street East and 131,133,135 Church Street by LEA dated January 2018, annual growth rate of 0.5% will be applied for the north-south directions along Mutual Street and Jarvis Street, and in the east-west directions along Queen Street East and Shuter Street.

Road Network Improvements – We do not anticipate any external road improvements to be in place in the horizon year of 2023 for this study.

Background Development Traffic – Upon initial review of the City of Toronto Development Applications database, the background developments in the study area was identified as summarized in **Table 1**.

Table 1: Identified Background Developments in the Study Area

#	Address of Development	Description	Application Status
1	60 Shuter Street	29-storey mixed-use building (328 residential units and 487m^2 of retail)	NOAC Issued
2	79 Shuter Street	32-storey residential building (234 units)	Under Review
3	60 Queen Street E	54-storey mixed-use building (364 residential units and ground floor retail)	Under Review
4	30 Mutual Street	Four (4) mixed-use buildings (1,139 residential units, 2,241m^2 of retail and 8,344m^2 of hotel)	OPA Approved by Council
5	59 Mutual Street	32-storey residential building (275 units)	Under Review
6	75 Mutual Street	36-storey mixed-use building (385 residential units, 285m^2 of retail and 509m^2 of office)	OMB Appeal
7	139 Church Street	49-storey mixed-use building (414 residential units and 480m^2 of ground floor retail)	Under Review
8	215 Church Street	Multi-storey mixed-use building (604 residential units and ground floor retail)	NOAC Issued
9	203 Jarvis Street	35-storey mixed-use building (222 residential units and 241 hotel rooms)	OMB Appeal

Trip Generation, Distribution and Assignment

The trip generation of the proposed development will be based on average proxy trip rates applied at similar developments during the weekday AM and PM peak periods as shown in **Table** 2.

Table 2: Residential Trip Rate Adopted for Background Developments

#	Address of Development	Residential Trip Rates Adopted for Background Developments					
		AM Peak			PM Peak		
		In	Out	Total	In	Out	Total
1	60 Shuter Street	0.03	0.10	0.13	0.08	0.05	0.13
2	79 Shuter Street	0.04	0.11	0.15	0.08	0.05	0.13
3	60 Queen Street E	0.02	0.10	0.12	0.08	0.04	0.11
4	30 Mutual Street	0.03	0.10	0.13	0.08	0.05	0.13

5	59 Mutual Street	0.04	0.11	0.15	0.08	0.05	0.13
6	75 Mutual Street	Not Available					
7	139 Church Street	0.02	0.10	0.12	0.08	0.04	0.12
8	215 Church Street	0.04	0.11	0.15	0.08	0.05	0.13
9	203 Jarvis Street	0.01	0.05	0.06	0.04	0.03	0.07
Average Residential Trip Rates		**0.03**	**0.10**	**0.13**	**0.08**	**0.05**	**0.12**

The general trip distribution utilized will be based on a review of the latest 2016 Transportation Tomorrow Survey (TTS) data in the vicinity of the subject site. Trip assignment will be revised accordingly to reflect the configuration of the site access, turning restrictions and logical routings.

Future Traffic Scenarios

Future background and future total analysis for the aforementioned intersections within the study area will be over the horizon year of 2023.

Parking & Loading

The site is currently under the jurisdiction of the City of Toronto Zoning By-Law 569-2013, which will be reviewed for parking and loading requirements. If a parking reduction is proposed, appropriate analyses and justification will be provided to illustrate that the proposed parking supply will meet the projected parking demand.

Site Plan Review

Site plan review will also be undertaken to ensure the vehicular movements can be accommodated at the proposed loading bay, parking lots, drive aisles, garage ramps, etc.

Should you have any comments with our assumptions or have any concerns, please do not hesitate to contact me.

Thanks

Timothy Chin, MSc(Eng)

Intersection Summary

Cycle Length: 76
Actuated Cycle Length: 76
Offset: 60 (79%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green
Natural Cycle: 60
Control Type: Pretimed
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Splits and Phases: 3: Jarvis St & Shuter St

Intersection Summary

Cycle Length: 76
Actuated Cycle Length: 76
Offset: 60 (79%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green
Natural Cycle: 60
Control Type: Pretimed
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Splits and Phases: 3: Jarvis St & Shuter St
